

Abstract of the Disclosure

10 A functionalized porous crystalline material is disclosed exhibiting
an X-ray diffraction pattern with at least one peak at a position greater than
about 1.8 nm d-spacing with a relative intensity of 100. The crystalline material
comprises a framework including metal atoms, oxygen atoms and at least one
organic group bonded between at least two of said metal atoms so as to be
15 integral with said framework, and wherein said organic group has at least one
sulfonate moiety bonded thereto.
